'Pandemic of the Boosted': UK Data Reveal 'Fatal Problem' With COVID Shots

According to an analysis by Public Health Scotland, PHE, UK official data from the UK and Australia, people who get four or more doses of a COVID-19 vaccine are about 100 times more likely to be hospitalized than those who are unvaccinated.

By Rob Verkerk Ph.D.

Go on — you may have been in two minds — but that's only because you've had a bad case of cognitive dissonance to thank us for all those terrible, twisted, conspiracy theorists.

Check out the official data for England from the Office for National Statistics (ONS) — and you'll see clear evidence for why you need to get your jabs up-to-date.

You'll be over 13 times less likely to die a death involving COVID-19. Your all-cause mortality risks, even, will be around two and a half times lower if you're fully jabbed — isn't that something of a bonus?

Office for statistics fiction

For the data-hungry among you, it's all there in Table 3 from the latest edition of the "Deaths by vaccination status, England" dataset courtesy of the ONS's National Immunization Management Service.

Look beneath the surface of these data and you'll find a problem, however. A fatal problem.

The panel dataset also tells you that you'll be 65% more likely to die from non-COVID-19 deaths if your jabs are fully up-to-date, compared with being unvaccinated.

That simply can't be!

You can't be that much more likely to die from non-COVID-19 causes unless you make it appear that way because your numbers got jumbled deliberately or accidentally along the way.

This one fairly statistic stands as a stark reminder that all the ONS data for England — that are relied on well beyond the territorial boundaries of England and even the UK — are flawed.

That in turn means that data and insight that have convinced you or loved ones to roll up their sleeves is WRONG. Plain and simple.

This latter point on non-COVID-19 deaths has been drawn to our attention by none other than Norman Fenton and Martin Neil, professors from Queen Mary University of London.

We've gone back to the original data that includes the latest edition of the dataset that takes in the entire period of UK vaccination from January 2021 through May 2022. Table 3 of the ONS dataset, and we've summarized it in Table 1 (see below).

The non-COVID-19 mortality data is indicated to hold to remind you of its impossibility and that makes the rest of the data flawed too because COVID-19 and non-COVID-19 mortality data are not independent of each other.

Status	COVID-19 vaccination status	COVID per 1,000, person years	% increased risk of death for unvaccinated compared with vaccinated
All-cause mortality	Unvaccinated	2337.5	244.2
	Fully vaccinated	957.4	
Deaths involving COVID-19	Unvaccinated	583.2	1398.3
	Fully vaccinated	34.5	
Non-Covid-19 deaths	Unvaccinated	1474.2	188.1
	Fully Vaccinated	892.9	

Table 1. Summary mortality data from the ONS for the period January 2021 to May 2022. Credit: ONS

Professors Fenton and Neil have previously explained, here and here, how these data were corrupted. They now also show that the figure of 1474 deaths per 100,000 person-years has been massively bumped up from those in recent history, looking more or less on par with those of the fully vaccinated (see the second table in Fenton and Neil's latest article).

One wonders how the public would have responded had the manipulations occurred in the opposite direction! In fact, we know how they'd respond — and so do those responsible for implementing or ignoring the data manipulation.

Down under

Now let's nudge across our beautiful, yet humanly-stressed, blue planet, from England to New South Wales (NSW), Australia, a part of the world that I was fortunate to be able to call home for over a decade.

With over 95% of the NSW population having received at least one jab, Brad Hazzard, NSW health minister, has slammed the over 30% of the 8 million people of NSW saying they need to "wake up," "switch off…[social media and switch on reality" and stop being so selfish.

The number of people in NSW hospitals with COVID-19 is clearly on the rise, moving toward the second highest peak since the start of the year (see figure below). Is it those infernal unvaccinated causing the problem again?

Figure 1. Number of people in New South Wales hospitals with COVID-19 by day, January 1 to July 9, 2022. Credit: NSW COVID-19 Weekly Data Summary

Well, yes, it would seem this is the official line. The latest surveillance report suggests the new waves of BA.4 and BA.5 Omicron variants are responsible, highlighting the recent upward trend that includes a 17% increase in hospitalizations (1,658 to 1,946) just in the last week.

The big message is the same as in England. Go get jabbed.

Take this statement from the surveillance report, for example:

> "Of the 79 people who were reported to have died with COVID-19, all were eligible for a third dose of a COVID-19 vaccine but only 62.05% of those eligible had received a third dose."

You can find contrary messages in the same report if you look for them.

Take this sentence that reminds us that none of the six people under 65 who died from COVID-19 were either healthy or unvaccinated:

> "Six people aged under 65 years died with COVID-19. All six cases had record of significant underlying health conditions that increase the risk of severe disease from COVID-19."

> "…Four of these cases had received 3 doses of a vaccine.

> "…Two of these cases had received 2 doses of a vaccine."

Digging beneath the surface reveals more problems with the official rhetoric.

The official NSW data from the last seven weeks — when NSW is meant to be grappling with the 'super-contagious' BA.4 and BA.5 Omicron subvariants — show hospitalized and ICU cases have vaccinated (one minimum) to four (maximum) times against COVID-19. were 45 times more likely to be hospitalized if they were unvaccinated.

This was brought to our attention by Joel Smalley, analyst, in a July 19 Substack post, just links to a powerful interactive app that allows anyone to play with the official NSW data on hospitalizations and deaths.

So this (Figure 2 below) is what the last seven weeks of data look like, in terms of hospitalizations (both ICU and non-ICU). The data have shown us hospitalization from four or more doses of COVID-19 'vaccines', while the first bar in each time period (mid-blue) shows us the hospitalizations among the unvaccinated.

The data are standardized per 1 million population so we remove bias given that so many are vaccinated with one or more doses, and so few are not. You don't need to be a rocket scientist to see the mid-blue to-four bars are relatively unchanged over the last six weeks and the green bars are going upward.

It's some of the most interesting data we've seen so far points to a dose-response issue — the more doses the more vulnerable you are to hospitalization. Not what the NSW government is telling the public, despite this being their data.

Figure 2. Rate of hospitalization (ICU and non-ICU) depending on vaccination status from May 28 through to July 9, 2022. Multiplier between unvaccinated and vaccinated highlighted in red rectangle.

It gets worse when you compare the extreme ends of the official NSW dose-response data: the unvaccinated versus those vaccinated with four or more doses.

We've done this in Table 2:

A. Hospitalisations, (ICU and non-ICU)			
Date	**No dose**	**1 dose**	**4+ doses**
04/06/2022	7.4	39.5	1 114.4
11/06/2022	8.9	40.1	120.4
18/06/2022	7.8	40.9	135
25/06/2022	9	39.4	108.3
02/07/2022	8.9	40.2	119.6
09/07/2022	9.8	42.4	216.1
Mean	**7.8**	**40.4**	**181.9**
B. Deaths			
Date	**No dose**	**1 dose**	**4+ doses**
04/06/2022	17.6	8	17
11/06/2022	11.1	10	13.8
18/06/2022	9.7	10.1	13
25/06/2022	11.1	9.1	31.9
02/07/2022	11.7	9.3	31.4
09/07/2022	16.9	10.6	19.4
Mean	**13.1**	**9.6**	**20.9**

Table 2. Hospitalizations and deaths in NSW among those who have received no COVID-19 vaccinations, and those who have received one or 4 or more doses. Credit: Official NSW data

Take-homes

The take-homes are staring us in the face. Whether you look at hospitalizations or deaths, those who're vaccinated with four or more doses are the worst off.

People who've received four doses plus are around 100 times more likely to be hospitalized than those who're unvaccinated.

This difference is a massive two orders of magnitude that is likely to include a hefty (read: real) signal regardless of how dirty the underlying data are. We also see what appears to be a clear dose-response — the more doses, the more likely you are to be hospitalized.

The mortality data aren't as clear, because the one-dose recipients appear the best off. This may be real, or it may be anomalous, bearing in mind the difference is less than one order of magnitude.

But should we ignore the difference between deaths among the unvaccinated and the ones injected four or more times? There are 1.75-fold more deaths among those with four plus COVID-19 injections compared with the unvaccinated.

However, you choose to interpret these data, it's impossible to use them to suggest that people who've had jabs are better off than those who are unvaccinated.

Nor are there ANY reliable data to suggest this is now a pandemic of the unvaccinated.

A pandemic of the heavily boosted

It seems the official NSW data already tell us the opposite: this is rapidly becoming a "pandemic of the vaccinated." The risks to this group of course go well beyond just COVID-19.

The public is just not being informed of the reality — and public health officials continue to beat the same drum using a defective narrative. The English data appear different at the surface, but there is clear evidence of data manipulation.

Even the emerging science is beginning to explain why an ever greater number of COVID-19 jabs is likely to contribute to greater risks for recipients. Possible mechanisms include immune system evasion, original antigenic sin and T-cell dysregulation.

Many of us are coming to the conclusion that we're living through the greatest ever manipulation of science, given the sheer number of people involved.

Anyone who still buys into the idea we can still vaccinate ourselves out of this surreal construct we have learned to call a 'pandemic' is likely to benefit from taking a close look at the English and NSW data discussed here, data that have been held in great secrecy by authorities around the world.

Time to take a reality check. Or can you turn a blind eye and accept the same reality Brad Hazzard talks of, in the belief that more and more COVID-19 vaccination will be the solution to COVID-19 and regaining normality?

This article omits key information. It does not correlate vaccination status with age and comorbidity. If 100% of the very old and sick have four jabs and 80% of the rest have three or less, a placebo would produce the same results. If you don't factor age in and correlate it with vaccine, you are playing the same dishonest game as the liberals.
